A Serre weight conjecture for mod *p* Hilbert modular forms

Shu SASAKI

31st August 2020

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Everything I say today is joint work with F. Diamond (DS). Some of it is joint with P. Kassaei (DKS).

My notes below contain a lot more details than what I intend to say.

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

Introduction

Let p be a rational prime. Let

$$\overline{\rho}: \operatorname{Gal}(\overline{\mathbb{Q}}/\mathbb{Q}) \to \operatorname{GL}_2(\overline{\mathbb{F}}_p)$$

(ロ)、(型)、(E)、(E)、 E) の(()

be a continuous, odd and irreducible representation over $\overline{\mathbb{F}}_{p}$.

Serre's conjecture

J.-P. Serre (1987) defined/specified

►
$$k(\overline{\rho}) \ge 2$$

• $N(\overline{\rho}) \geq 1$, the Artin conductor prime to p,

and conjectured that there should be a cuspidal modular eigenform f of weight $k(\overline{\rho})$ and level $N(\overline{\rho})$ such that (for a choice of $\mathbb{C} \simeq \overline{\mathbb{Q}}_p$),

$$f \rightsquigarrow \overline{\rho}_f : \operatorname{Gal}(\overline{\mathbb{Q}}/\mathbb{Q}) \xrightarrow{\rho_f} \operatorname{GL}_2(\overline{\mathbb{Z}}_p) \twoheadrightarrow \operatorname{GL}_2(\overline{\mathbb{F}}_p)$$

is isomorphic to $\overline{\rho}$.

Serre's conjecture in the Hilbert case

Generalising the weight part of Serre's conjecture ("if $\overline{\rho}$ is modular, of what weight exactly?") to the setting of mod p HMFs (of regular weights) was initiated by Buzzard-Diamond-Jarvis (2010).

The BDJ conjecture (p > 2) has been proved almost completely by Gee, Liu and Savitt.

Today, I will formulate a Serre weight conjecture for all weights within geometric theory of Hilbert modular forms (Katz, Goren, Andreatta-Goren,...).

We are generalising Edixhoven's reformulation (1992) of Serre's conjecture.

Geometry (of Shimura varieties) seems to provide genuinely new input into the mix.

To start with

Fix $\overline{\mathbb{Q}}$, $\overline{\mathbb{Q}}_p$ and $\overline{\mathbb{F}}_p$ and fix an embedding $\imath: \overline{\mathbb{Q}} \to \overline{\mathbb{Q}}_p$

once for all.

Let

$$\Sigma = \iota \circ \operatorname{Hom}_{\mathbb{Q}}(F, \overline{\mathbb{Q}}) = \operatorname{Hom}_{\mathbb{Q}}(F, \overline{\mathbb{Q}}_p).$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Suppose that there is only one prime v in \mathcal{O}_F above p. Let $\mathbb{F}_v = \mathcal{O}_F / v$ denote the residue field at v. If $F_v^r \subset F_v$ denote the maximal unramified extension of \mathbb{Q}_p of degree f_v , then the restriction to F_v defines a surjection

$$\operatorname{Hom}_{\mathbb{Q}}(F,\overline{\mathbb{Q}}_{p}) = \Sigma \twoheadrightarrow \Sigma^{r} = \operatorname{Hom}_{\mathbb{Q}_{p}}(F_{v}^{r},\overline{\mathbb{Q}}_{p}) \circlearrowleft \phi.$$

Suppose that $\{\tau_{\beta}(1), \ldots, \tau_{\beta}(e_{\nu})\} \subset \Sigma$ is the pre-image of β in Σ^{r} . Define an index shift Φ on Σ :

$$\cdots \rightsquigarrow \tau_{\phi^{-1} \circ \beta}(e_{\nu}) \stackrel{\phi}{\rightsquigarrow} \tau_{\beta}(1) \rightsquigarrow \cdots \rightsquigarrow \tau_{\beta}(e_{\nu}) \stackrel{\phi}{\rightsquigarrow} \tau_{\phi \circ \beta}(1) \rightsquigarrow \cdots$$

・ロト ・ 目 ・ ・ ヨト ・ ヨ ・ うへつ

Models of HMFs

Let

$$G = \operatorname{Res}_{F/\mathbb{Q}}\operatorname{GL}_2$$

and let

- Γ ⊂ G(A[∞]) maximal compact hyperspecial at p, which we
 always assume sufficiently small,
- (Rapoport/Deligne-Pappas/Pappas-Rapoport) a smooth integral model Y_Γ over Z
 _p for

$$G(\mathbb{Q})ackslash(\mathbb{C}-\mathbb{R})^{\Sigma} imes G(\mathbb{A}^{\infty})/\Gamma$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Pappas-Rapoport

The Pappas-Rapoport integral model Y_{Γ} parametrises HBAVs $s : A \to S$ of PEL type (in the sense of DP) such that the locally free \mathcal{O}_S -module of rank $[F : \mathbb{Q}] = d = e_v f_v$ with \mathcal{O}_F action

$$\omega = s_* \Omega_{A/S} = \bigoplus_{\beta \in \Sigma^r} \omega_\beta$$

where ω_{β} (locally free \mathcal{O}_{S} -module of rank e_{v}) comes equipped with a filtration (a 'complete flag')

$$0=\omega_eta(0)\subset\omega_eta(1)\subset\cdots\subset\omega_eta(e_v)=\omega_eta$$

such that \mathscr{O}_F acts via $\tau \in \Sigma$ on $\omega_{\tau} := \omega_{\beta}(i)/\omega_{\beta}(i-1)$, when τ is of the form $\tau = \tau_{\beta}(i)$.

When $e_v = 1$, ω is locally free module of rank 1 over $\mathscr{O}_F \otimes_{\mathbb{Z}} \mathscr{O}_S$.

Automorphic bundle $\mathscr{A}_{(k,\ell)}$

► associated to (k, ℓ) ∈ Z^Σ × Z^Σ, we have the automorphic line bundle

$$\mathscr{A}_{(k,\ell)} = \bigotimes_{\tau \in \Sigma} \omega_{\tau}^{k_{\tau}} \otimes \delta_{\tau}^{\ell_{\tau}}$$

where ω_{τ} is a locally-free-of-rank-1-over- $\mathcal{O}_{Y_{\Gamma}}$ piece of ω on which \mathcal{O}_{F} acts via τ , and where

$$\delta = \bigwedge_{\mathscr{O}_{\mathsf{F}} \otimes_{\mathbb{Z}} \mathscr{O}_{\mathsf{Y}_{\mathsf{F}}}}^{2} \mathsf{R}^{1} s_{*} \Omega^{\bullet}_{\mathsf{A}/\mathsf{Y}_{\mathsf{F}}}$$

is free of rank 1 over $\mathscr{O}_F \otimes_{\mathbb{Z}} \mathscr{O}_{Y_{\Gamma}}$ and δ_{τ} is defined similarly.

The space of mod p Hilbert modular forms of weight (k, ℓ) and of level Γ is defined to be

$$H^0(\overline{Y}_{\Gamma},\mathscr{A}_{(k,\ell)})$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

where $\overline{Y}_{\Gamma} = Y_{\Gamma} \times \overline{\mathbb{F}}_{p}$.

$F \neq \mathbb{Q}$

When $F \neq \mathbb{Q}$,

every Hilbert modular form of weight (k, ℓ) over Q_p ≃ C has its weight paritious, i.e. k_τ + 2ℓ_τ is independent of τ.

There are a lot more mod p Hilbert modular forms that are not in the image of

$$H^0(Y_{\Gamma}, \mathscr{A}_{(k,\ell)}) \to H^0(\overline{Y}_{\Gamma}, \mathscr{A}_{(k,\ell)}).$$

In stark contract to the case F = Q, there are lots of mod p Hilbert modular forms of '(partially) negative weights'.

Example ($\ell = 0$)

Emerton-Reduzzi-Xiao's partial Hasse invariants H_{τ} : the Verschibung $V = (\operatorname{Fr}_{A^{\vee}})^{\vee} : A^{(p)} \to A$ gives rise to

$$V^*: \overline{\omega}_{\beta} \to (\operatorname{Fr}^*\overline{\omega})_{\beta} = \overline{\omega}^{p}_{\phi^{-1} \circ \beta}$$

which breaks up into maps on $\overline{\omega}_{\tau_{\beta}(i)} = \overline{\omega}_{\beta}(i)/\overline{\omega}_{\beta}(i-1)$

 H_{τ} of weight

$$h_{ au} = \left\{ egin{array}{cc} 1\Phi^{-1} au + (-1) au & ext{if } au = au_eta(i) ext{ for } e_{ au} \geq i \geq 2, \ p\Phi^{-1} au + (-1) au & ext{if } au = au_eta(1) \end{array}
ight.$$

(日) (四) (日) (日) (日)

Automorphic Galois representations

Theorem (DS)

Let f be an element $H^0(\overline{Y}_{\Gamma}, \mathscr{A}_{(k,\ell)})$ and S be a finite set of finite places in F, containing all v dividing p and all v such that $\operatorname{GL}_2(\mathscr{O}_{F_v}) \not\subset \Gamma$. Suppose that

$$T_{\mathbf{v}}f = \alpha_{\mathbf{v}}f$$

and

$$S_v f = \beta_v f$$

for all v not in S. Then there exists a continuous representation

$$\overline{\rho}_f : \operatorname{Gal}(\overline{F}/F) \to \operatorname{GL}_2(\overline{\mathbb{F}}_p)$$

which is unramified outside S and the characteristic polynomial in X of $\overline{\rho}_f(\operatorname{Frob}_v)$ is

$$X^2 - \alpha_v X + \beta_v \mathsf{N}_{F/\mathbb{Q}}(v).$$

Remark

The novelty of our theorem is that (k, ℓ) does not have to satisfy the parity condition $(k_{\tau} + 2\ell_{\tau}$ is independent of τ in Σ). The parity case is known by Emerton-Reduzzi-Xiao $(e_{\nu} = 1)$, RX $(e_{\nu} \ge 1)$, and Goldring-Koskivirta (general Shimura varieties).

Conjecture (Folklore)

Let

$$\overline{\rho}: \operatorname{Gal}(\overline{F}/F) \to \operatorname{GL}_2(\overline{\mathbb{F}}_p)$$

be totally odd, continuous and irreducible. Then $\overline{\rho}$ is modular in the sense above.

Idea of our proof for the theorem when $e_{
m v}=1$

Recall that not every $\overline{\rho}$ arises as the reduction of a characteristic zero eigenform of level prime to p.

How do we deal with HMFs of non-paritous weight? We lift mod p HMFs of parallel weight but of level $\Gamma \cap \Gamma_1(p)$.

The idea then is to establish congruences, i.e., find an eigenform of parallel weight N + 2 (to be specified) and level $\Gamma \cap \Gamma_1(p)$ which is congruent mod p (and Hasse) to f and which can be lifted to a characteristic zero eigenform when N is sufficiently large (the ampleness of a line bundle over X_{Γ}).

Preliminary reduction steps

• Γ may be taken to be a sufficiently small principal congruence subgroup of level prime to p,

• by twisting if necessary, WLOG $\ell_{ au} = -1$ for every au in Σ ,

• (can always) find $N \in \mathbb{Z}$ and $r \in \mathbb{Z}^{\Sigma}$ such that $0 \le r_{\tau} \le p-1$ but not all r_{τ} are simultaneously p-1 such that k - (N+2-r) is a linear combination of h_{τ} 's. Multiplying H_{τ} 's defines an injection of global sections $\rightsquigarrow k = N + 2 - r$.

$$\pi: Y_{\Gamma \cap \Gamma_1(p)} \to Y_{\Gamma}$$

with extension

$$\pi: X_{\Gamma \cap \Gamma_1(p)} \to X_{\Gamma}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ● ●

to minimal compactifications]

• observe that there is a Hecke equivariant injection

$$H^{0}(\overline{Y}_{\Gamma}, \mathscr{A}_{(k,-1)}) \hookrightarrow H^{0}(\overline{Y}_{\Gamma \cap \Gamma_{1}(p)}, \mathscr{A}_{(N+2,-1)})$$

with its image contained in

$$\begin{array}{rcl} & H^{0}(\overline{X}_{\Gamma\cap\Gamma_{1}(p)},\overline{\iota_{*}K}\otimes_{\mathscr{O}_{\overline{X}_{\Gamma\cap\Gamma_{1}(p)}}}\overline{\omega}^{N})\\ \subset & H^{0}(\overline{X}_{\Gamma\cap\Gamma_{1}(p)},\overline{\iota_{*}K}\otimes_{\mathscr{O}_{\overline{X}_{\Gamma\cap\Gamma_{1}(p)}}}\overline{\omega}^{N})\\ = & H^{0}(\overline{Y}_{\Gamma\cap\Gamma_{1}(p)},\mathscr{A}_{(N+2,-1)}) \end{array}$$

where

$$\blacktriangleright \iota: Y_{\Gamma \cap \Gamma_1(p)} \hookrightarrow X_{\Gamma \cap \Gamma_1(p)},$$

K denotes the dualising sheaf over the Cohen-Macaulay scheme Y_{Γ∩Γ1(p)},

▶ and $\omega = \omega_{X_{\Gamma \cap \Gamma_1(\rho)}}$ here denotes the push-forward by ι of the analogue of $\mathscr{A}_{(1,0)}$ over $Y_{\Gamma \cap \Gamma_1(\rho)}$ (it is also the pull-back by π of the ample line bundle $\omega = \omega_{X_{\Gamma}}$ over X_{Γ}).

Theorem (DKS)

$$R^r \pi_* K = 0$$

for r > 0.

Proved by carefully describing fibres of the degeneracy map

$$\begin{array}{ccc} \overline{Y}_{\Gamma \cap \Gamma_{0}(\rho)} & \longrightarrow & \overline{Y}_{\Gamma} \\ \cup & & \cup \\ (\text{max GK-strata}) & \longrightarrow & (\text{EO}/\text{Hasse strata}) \end{array}$$

・ロト・「四ト・「田下・「田下・(日下

• the DKS theorem implies

$$R^1\pi_*(\iota_*K)=0,$$

hence

$$\pi_*(\iota_*K) \to \pi_*(\overline{\iota_*K})$$

is surjective and, combined with the ampleness of ω , it follows that

$$\begin{array}{cccc} H^{0}(X_{\Gamma}, \pi_{*}\iota_{*}K \otimes_{\mathscr{O}_{X_{\Gamma}}} \omega^{N}) & \longrightarrow & H^{0}(X_{\Gamma}, \pi_{*}(\overline{\iota_{*}K}) \otimes_{\mathscr{O}_{X_{\Gamma}}} \overline{\omega}^{N}) \\ & & || \\ H^{0}(X_{\Gamma \cap \Gamma_{1}(p)}, \mathscr{A}_{(N+2,-1)}) & & H^{0}(\overline{X}_{\Gamma \cap \Gamma_{1}(p)}, \overline{\iota_{*}K} \otimes_{\mathscr{O}_{\overline{X}_{\Gamma \cap \Gamma_{1}(p)}}} \overline{\omega}^{N}) \end{array}$$

is surjective when N is sufficiently large, because

$$H^1(X_{\Gamma},\pi_*\iota_*K\otimes_{\mathscr{O}_{X_{\Gamma}}}\omega^N)=0.$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

To recap, the image of the Hecke equivariant injection

$$H^{0}(\overline{Y}_{\Gamma}, \mathscr{A}_{(k,-1)}) \hookrightarrow H^{0}(\overline{Y}_{\Gamma \cap \Gamma_{1}(p)}, \mathscr{A}_{(N+2,-1)})$$

(k = 2 + N - r) is contained in

$$H^{0}(\overline{X}_{\Gamma\cap\Gamma_{1}(p)},\overline{\iota_{*}K}\otimes_{\mathscr{O}_{\overline{X}_{\Gamma\cap\Gamma_{1}(p)}}}\overline{\omega}^{N}) \twoheadleftarrow H^{0}(X_{\Gamma\cap\Gamma_{1}(p)},\mathscr{A}_{(N+2,-1)}).$$

To finish off, we make appeal to:

• there exists a Galois representation associated to an eigenform in $H^0(X_{\Gamma\cap\Gamma_1(p)}, \mathscr{A}_{(N+2,-1)})[1/p]$ by work of Carayol, Taylor,.... Q.E.D.

Remark

The $e_v > 1$ case can be dealt with similarly– to build an ample line bundle over X_{Γ} , we incorporate RX's observation about a line bundle relative ample over $Y_{\Gamma}^{\rm DP}$.

In preparation of the DS conjecture

Definition (the Diamond-Kassaei minimal cone) Let $\Xi^{DK} \subset \mathbb{Z}^{\Sigma}$ be the set of $k = \sum_{\tau} k_{\tau} \tau$ such that $\blacktriangleright pk_{\tau} \ge k_{\Phi^{-1}\tau}$ if τ is of the form $\tau_{\beta}(1)$, $\flat k_{\tau} \ge k_{\Phi^{-1}\tau}$ if τ is of the form $\tau_{\beta}(i)$ for $2 \le i \le e_{v}$. And let Ξ be the subset of $k \in \Xi^{DK}$ such that $k_{\tau} \ge 1$ for every τ in Σ .

Definition

$$k \succeq k'$$

if k - k' is a non-negative integer linear combination of the weights h_{τ} of the partial Hasse invariants.

Conjecture

Conjecture (DS)

Let

$$\overline{\rho}: \operatorname{Gal}(\overline{F}/F) \to \operatorname{GL}_2(\overline{\mathbb{F}}_p),$$

totally odd, continuous, irreducible.

Fix ℓ in \mathbb{Z}^{Σ} . Then there exists $k(\overline{\rho}, \ell)$ lying in Ξ satisfying the following conditions:

- ▶ $\overline{\rho}$ is modular of weight (k, ℓ) if and only if $k \succeq k(\overline{\rho}, \ell)$
- if k ∈ Ξ, then k ≽ k(p̄, ℓ) if and only if p̄_v = p̄|_{Gal(Q̄_p/F_v)} has a crystalline lift of weight (k, ℓ), i.e. of Hodge-Tate weight (k + ℓ − 1, ℓ).

Remark

Assuming $\overline{\rho}$ is (geometrically) modular, the existence of $k(\overline{\rho}, \ell)$ is suggested by DK- the weight filtration w(f) of a mod p HMF f lies in Ξ^{DK} .

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

The first condition: 'minimality'

Assuming the existence of $k(\overline{\rho}, \ell) \in \Xi$ satisfying the first condition, one sees that

- the conjecture implies the folklore conjecture earlier,
- the conjecture (i.e. the second condition) boils down to

Conjecture * (DS)

Suppose that $\overline{\rho}$ is irreducible and modular. If $k \in \Xi$, then $\overline{\rho}$ is modular of weight (k, ℓ) if and only if $\overline{\rho}_v$ has crystalline lift of weight (k, ℓ) .

The second condition: *p*-adic Hodge-theory

Assuming the existence of $k(\overline{\rho}, \ell) \in \Xi$ satisfying the second condition, Conjecture follows from Conjecture * if we know

Conjecture ** (DS)

Suppose that $\overline{\rho}$ is irreducible and $\overline{\rho} \simeq \overline{\rho}_f$ for some f. Then $w(f) \in \Xi$.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

The second condition is suggested by the Breuil-Mézard conjecture and modular representation theory of $\operatorname{GL}_2(\mathbb{F}_v)$ - it is somehow the underlying theme of DKS.

The qualification ' $k \in \Xi$ ' in the second condition is needed– when $k \notin \Xi$, the condition $k \succeq k(\overline{\rho}, \ell)$ does not imply that $\overline{\rho}_v$ has crystalline lift of weight (k, ℓ) .

Example when $F = \mathbb{Q}$ and $\ell = 0$

$$\begin{split} \Xi^{\mathrm{DK}} &= \{k \geq 0\},\\ \Xi &= \{k \geq 1\},\\ k \succeq k' \text{ if } k - k' &= (p-1)n \geq 0. \end{split}$$

There exists $k(\overline{\rho}) \ge 1$ such that the following are equivalent:

- $\overline{\rho}$ is modular of weight k,
- $\blacktriangleright k \succeq k(\overline{\rho}),$

 $\triangleright \overline{\rho}_{p}$ has a crystalline lift of weight (k, 0),

for every $k \ge 1$.

 $\rightsquigarrow k(\overline{\rho})$ is the smallest possible weight for which $\overline{\rho}$ is modular.

How is our conjecture related to the Buzzard-Diamond-Jarvis conjecture?

Algebraic modularity (BDJ) for pedants

Let V be a finite-dimensional $\overline{\mathbb{F}}_{p}$ -representation of $\operatorname{GL}_{2}(\mathbb{F}_{v})$. We say that $\overline{\rho}$ is algebraic modular of weight V if there exist

- ▶ a quaternion algebra D over F split at p and ramified at all but one place in Hom_Q(F, ℝ),
- ▶ a sufficiently small open compact subgroup $U \subset (D \otimes_F \mathbb{A}_F^\infty)^\times$ (\rightsquigarrow the Shimura curve Y_U over F) such that
 - U is of level prime to p (i.e. $\operatorname{GL}_2(\mathscr{O}_{F_v}) \subset U$),
 - If U⁺ = ker(U → GL₂(𝔽_ν)), then Y_{U⁺} → Y_U is étale of degree equal to |GL₂(𝔽_ν)|

such that $\overline{\rho}$ is an $\overline{\mathbb{F}}_{\rho}[\operatorname{Gal}(\overline{F}/F)]$ -subquotient of $H^{1}_{\operatorname{\acute{e}t}}(Y_{U} \times \overline{F}, \mathcal{V})(1)$.

Algebraic modular = Geometric modular?

Conjecture (DS) Let $(k, \ell) \in \mathbb{Z}^{\Sigma} \times \mathbb{Z}^{\Sigma}$ and $k_{\tau} \geq 2$ for every τ in Σ . If $\overline{\rho}$ is algebraic modular of weight (k, ℓ) , i.e., of representation weight

$$V_{k,1-k-\ell} = \bigotimes_{ au} \operatorname{Sym}^{k_{ au}-2} \operatorname{det}^{1-k_{ au}-\ell_{ au}}(V_{\operatorname{st}} \otimes_{ au} \overline{\mathbb{F}}_{
ho}),$$

(where $V_{\rm st}$ is the standard representation of ${\rm GL}_2(\mathbb{F}_{\nu})$ on two copies of \mathbb{F}_{ν}) then $\overline{\rho}$ is modular of weight (k, ℓ) .

If furthermore $k \in \Xi$, the converse holds. This is false if $k \notin \Xi$!

Remarks

We know that if $\overline{\rho}$ is algebraic modular of paritious weight (k, ℓ) , then $\overline{\rho}$ is modular of weight (k, ℓ) .

By our construction of modular Galois representations, if $\overline{\rho}$ is modular of some weight, $\overline{\rho}$ is algebraic modular of some weight.

Conjecture (Recap)

Conjecture (DS)

Let

$$\overline{\rho}: \operatorname{Gal}(\overline{F}/F) \to \operatorname{GL}_2(\overline{\mathbb{F}}_p),$$

totally odd, continuous, irreducible.

Fix ℓ in \mathbb{Z}^{Σ} . Then there exists $k(\overline{\rho}, \ell)$ lying in Ξ satisfying the following conditions:

- $\overline{\rho}$ is modular of weight (k, ℓ) if and only if $k \succeq k(\overline{\rho}, \ell)$
- if k ∈ Ξ, then k ≽ k(p̄, ℓ) if and only if p̄_v = p̄|_{Gal(Q̄_p/F_v)} has a crystalline lift of weight (k, ℓ), i.e. of Hodge-Tate weight (k + ℓ − 1, ℓ).

(recap)

Assuming 'minimal weight' $k(\overline{\rho}, \ell) \in \Xi$ exists (that satisfies the first condition), the second condition boils down to:

Conjecture * (DS)

Suppose that $\overline{\rho}$ is irreducible and modular. If $k \in \Xi$, then $\overline{\rho}$ is modular of weight (k, ℓ) if and only if $\overline{\rho}_v$ has crystalline lift of weight (k, ℓ) .

Example when $[F : \mathbb{Q}] = 2$, $e_v = 0$ and $\ell = 0$

Suppose $[F : \mathbb{Q}] = 2$ and $e_v = 0$. Hence $\Sigma = \Sigma^r$. Fixing τ in Σ ,

$$\boldsymbol{\Sigma} = \{\tau, \phi \circ \tau = \phi^{-1} \circ \tau\}$$

and we will write weights labelled by τ on the left of every pair. We furthermore assume $\ell = (0, 0)$.

Theorem (DS) Let $2 < r \le p$. Suppose that $\overline{\rho} : \operatorname{Gal}(\overline{F}/F) \to \operatorname{GL}_2(\overline{\mathbb{F}}_p)$ is irreducible and modular.

If $\overline{\rho}_{v}$ has crystalline lift of weight

((r, 1), (0, 0))

(=HT weight ((r - 1, 0), (0, 0))) then $\overline{\rho}$ is (geometric) modular of weight

((r, 1), (0, 0)).

Proof (Sketch)

For brevity, we furthermore assume that $\overline{\rho}$ is of Taylor-Wiles type-the exceptional case can be dealt with by an ad hoc argument.

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

Step 1

Given that $\overline{\rho}_v$ has crystalline lift of weight

((r, 1), (0, 0)),

we deduce from p-adic Hodge theory that $\overline{\rho}_v$ also has crystalline lifts of weight

$$(k, \ell) = ((r - 1, p + 1), (0, 0))$$

and

$$(k', \ell') = ((r + 1, p + 1), (-1, 0)).$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Step 2: algebraic companion forms

By work of Gee and his collaborators on the BDJ conjecture that $\overline{\rho}$ is algebraic modular of weight (k, ℓ) (=weight $V_{k,1-k-\ell}$) and (k', ℓ') .

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Step 3: geometric companion forms

Since r and 1 are paritious, $\overline{\rho}$ is geometric modular of weight (k, ℓ) and (k', ℓ') .

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬぐ

Step 4: combinatorics

Let f (resp. f') be a geometric HMF of weight (k, ℓ) (resp. (k', ℓ')) such that $\overline{\rho}_f \simeq \overline{\rho}$ (resp. $\overline{\rho} \simeq \overline{\rho}_{f'}$). One observes

• $\theta_{\tau}(f)$ is of weight

((r-1, p+1), (0, 0)) + ((1, p), (-1, 0)) = ((r, 2p+1), (-1, 0)),

• $f'H_{\tau}$ is an eigenform of weight

((r+1, p+1), (-1, 0))+((-1, p), (0, 0)) = ((r, 2p+1), (-1, 0)),

 θ_τ(f) = f'H_τ (by replacing them by forms of higher level if necessary− so that q-expansion coefficients at 'bad primes' are 0)
 θ -operators/cycles

Theorem (AG)

For any HMF f of weight (k, ℓ) , the image $\theta_{\tau}(f)$ is divisible by H_{τ} if and only if f is divisible by H_{τ} or p divides k_{τ} .

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Step 5: a mod p HMF of partial weight one

Deduce from the theorem that f is divisible by H_{τ} . The HMF f/H_{τ} of weight

$$((r-1, p+1), (0, 0)) - ((-1, p), (0, 0)) = ((r, 1), (0, 0))$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

is what we are looking for.

Remarks

The argument is reversible except that we do not know the 'algebraic modular = geometric modular' conjecture (in particular we do not know 'geometric modular \Rightarrow algebraic modular' even in the paritious case).

When $[F : \mathbb{Q}] = 2 = e_v$ and $\Sigma = \{\tau(1), \tau(2)\}$, we can prove: if $\overline{\rho}_v$ has crystalline lift of weight ((1, r), (0, 0)), then $\overline{\rho}$ is modular of weight ((1, r), (0, 0)).

Final remark

We have seen the interplay between algebraic weights and geometric weights:

$$V_{k,1-k-\ell} \nleftrightarrow \mathscr{A}_{(k,\ell)}.$$

In my work with FD and P. Kassaei, we make intrinsic connections between mod p representations of $\operatorname{GL}_2(\mathbb{F}_v)$ and mod p geometry of the Shimura variety for $G = \operatorname{Res}_{F/\mathbb{O}}\operatorname{GL}_2$:

- the JH factors in $\operatorname{Ind}_{\mathcal{B}(\mathbb{F}_{\nu})}^{\operatorname{GL}_{2}(\mathbb{F}_{\nu})}\chi$, where χ is a character $\mathbb{F}_{\nu}^{\times} \to \overline{\mathbb{F}}_{\rho}^{\times}$
- the graded pieces of a filtration on the χ-isotypic component of the space H⁰(Y_{Γ∩Γ1(p)}, K) of mod p HMFs of parallel weight 2 and level Γ ∩ Γ1(p)

Thank you very much for listening.
